

Buildathon Developer Setup Guide

Welcome to the Hackathon! This guide will help you prepare your local machine for building your prototype. Don't worry if you aren't "technical"—we have Claude Code to help you with the heavy lifting.

Setting up Claude Desktop

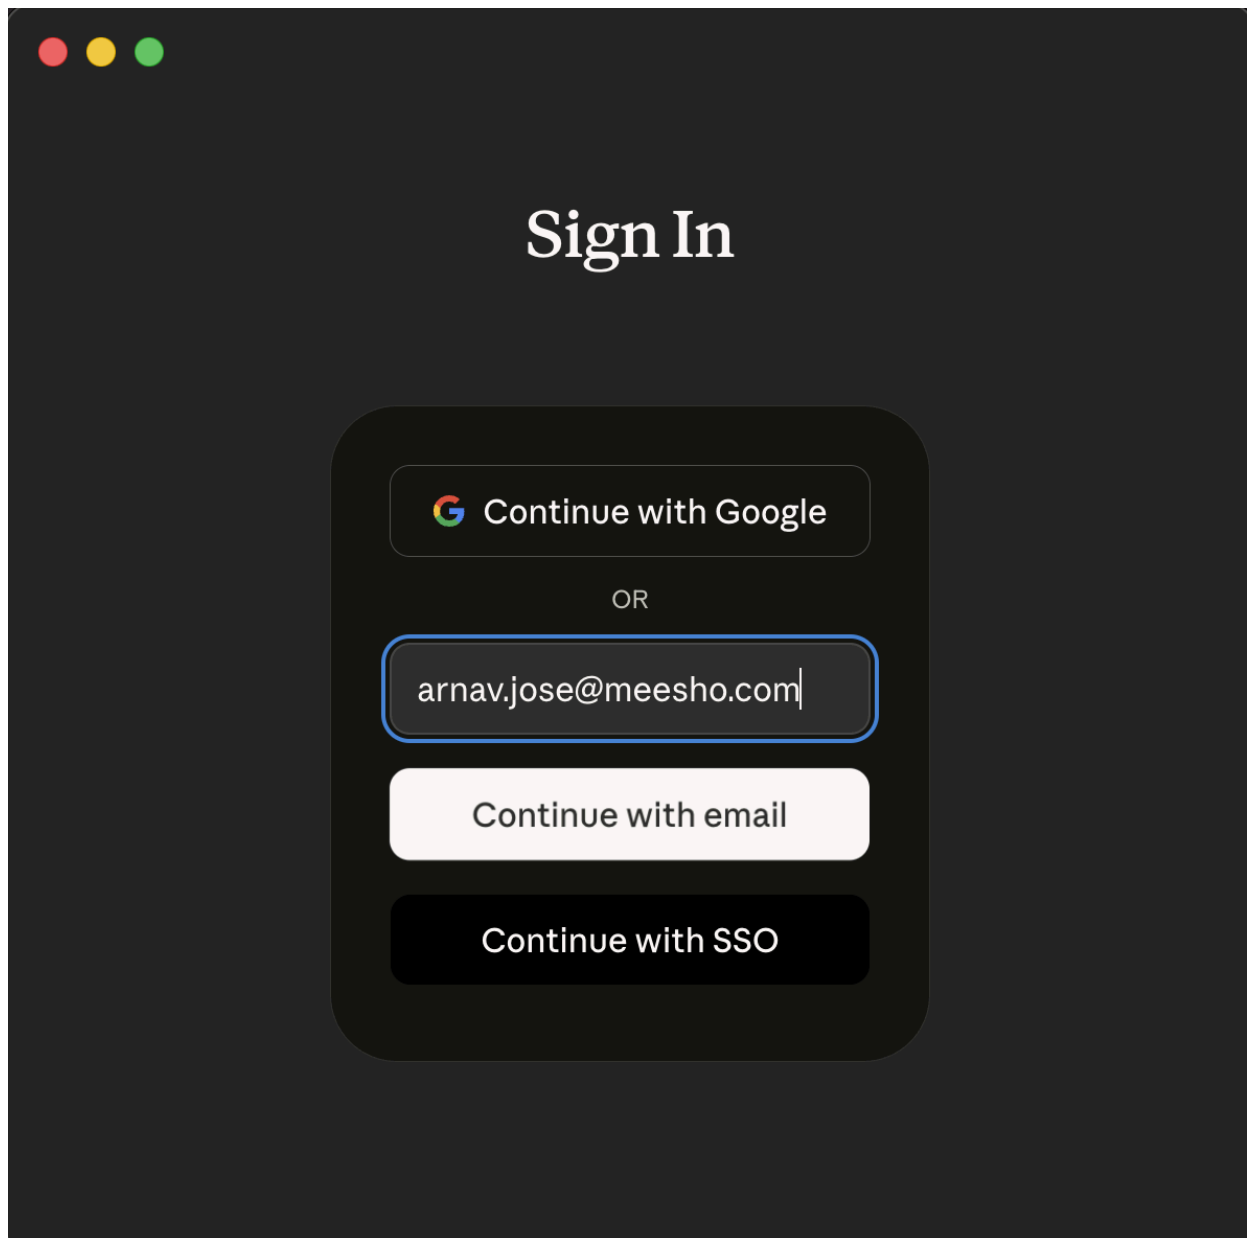

Install Claude via either Iru, if available (search Claude on the left)

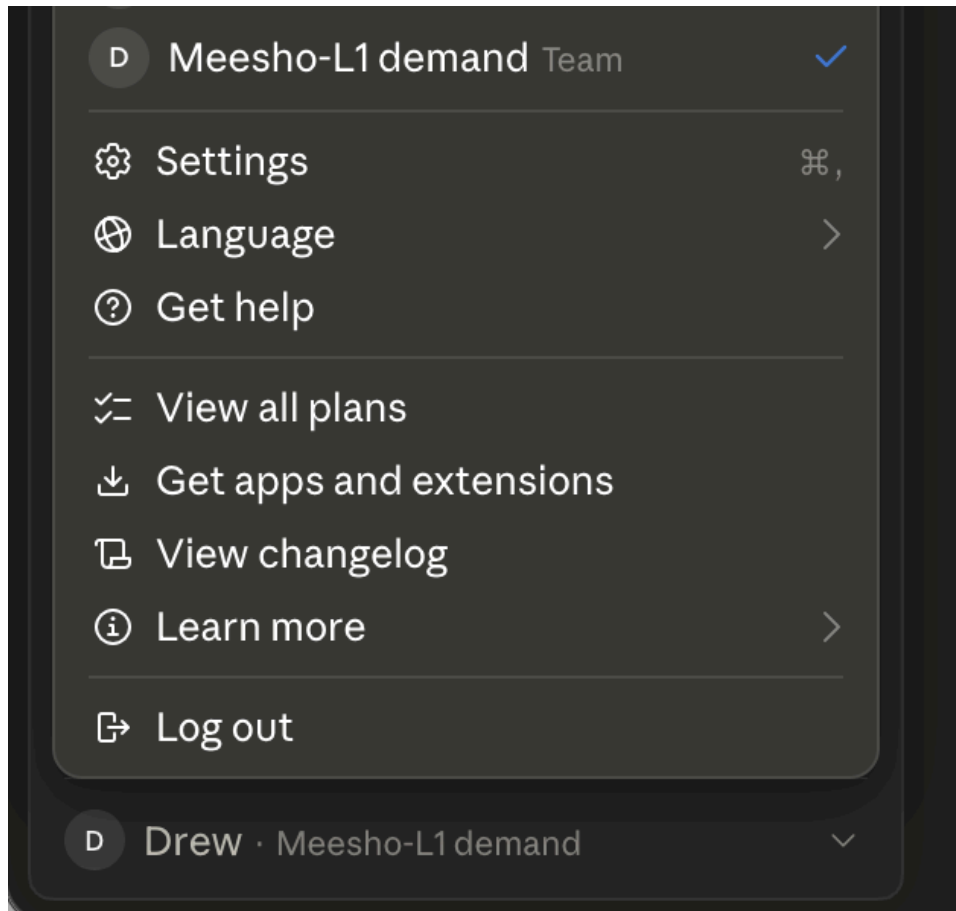

Or via the website: <https://claude.com/download>

After installing the application you must sign-in via your meesho email, and click

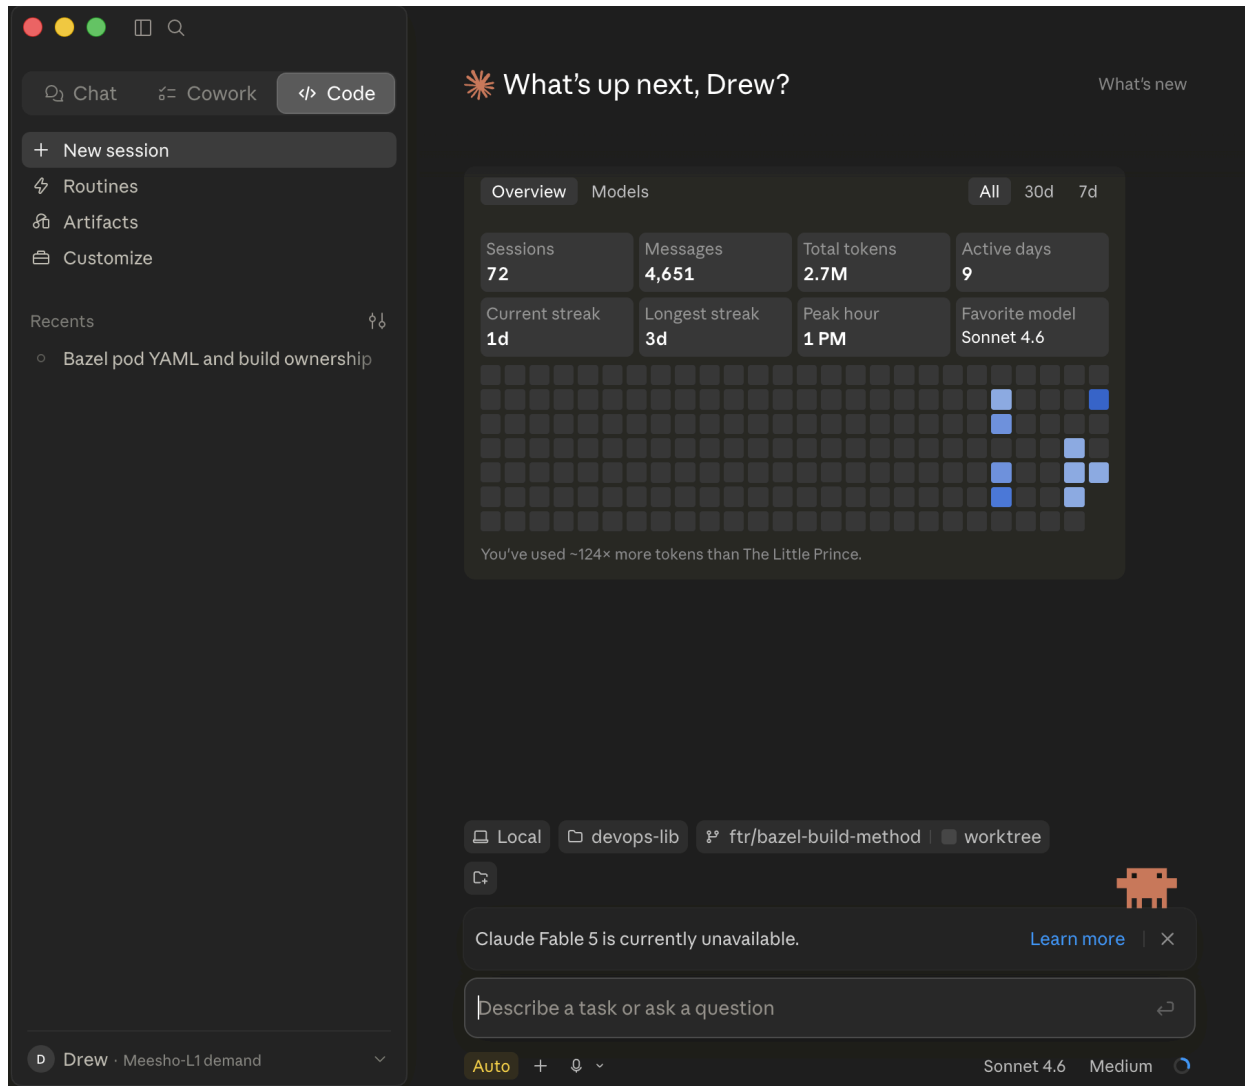

“Continue with SSO”. You will then be redirected to your browser and log in via google.

In the bottom left of Claude, click on your profile picture and make sure you have selected a team. You must have gotten an invite via e-mail.

You can then click on Code in the left sidebar, and then + New session. This will open a new chat, where you can select the folder you wish to work in.

Application Component Requirements

During this Buildathon, all submissions must use the following *only*

Programming languages:

- React (This is where your user interface will live)
- [Node.js](#) (Backend, This is where your data and logic will live).
- Golang (another option for backend)

Database:

- SQLite only (via better-sqlite3 in [node.js](#) and mattn/go-sqlite3 for golang. Claude will help install)

Local Machine Requirements

To build and run your project, you will need several tools installed on your computer.

Note on Claude Skills: For items marked with an asterisk (*), a specialized "Claude Skill" will be provided by EOD Friday **Jun 26, 2026** to automate the installation for you. You only need to install these manually if you want to get a head start.

Tool	Purpose	Setup Method
Claude Desktop	Your primary AI coding assistant for this event.	Manual Install ▾
Docker Desktop*	Creates a "bubble" (container) so your code runs exactly the same on every machine.	Claude Skill or Manual ▾
NPM & Node.js 24*	The "engine" used to run JavaScript-based applications.	Claude Skill or Manual ▾
Go 1.26*	An optional alternative "engine" if you prefer it over Node.js.	Claude Skill or Manual ... ▾

Technical Configurations

When you begin building your **Demo Prototype (MVP)**, ensure your application is configured to use the following communication "doors" (ports) on your computer:

- **Frontend** - Language: React & Port: 9080.
- **Backend** - Language: Nodejs/Golang & Port: 8090

Claude will handle these, but in case there are some errors due to other applications on your computer using them, those programs will have to be closed
