

Buildathon FAQs

Q: Why can't I see the option to add a marketplace in Claude?

A: This usually happens if you are running an outdated or unsupported version. Please update your Claude application to the specific version mentioned in our official buildathon documentation.

Q: What URL do I use to add the marketplace?

A: Please use the following GitHub repository link:

<https://github.com/shatwik-pandey-meesho/hackathon-skills>

Q: I added the marketplace, but the skills aren't showing up. How do I fix this?

A: First, navigate to your **Settings** and locate the marketplace you just added. Click the **gear icon** next to it once. You should see a pop-up confirming the skills are installed.

If they still don't appear, it might be a syncing delay. Try the following:

1. Close the Claude application completely.
2. Reopen the app and start a new chat.
3. If the issue persists, verify you are on the correct Claude version (as per the documentation) and try re-adding the marketplace.

Q: Why are the skills visible in Claude Chat and Cowork, but missing from Claude Code?

A: The marketplace needs to be added directly within the Claude Code interface, rather than Chat. Select the **Code** option, navigate to **Customize > Plugins**, and add the marketplace there. If you don't see the option to add it, close the application, verify your update version, and try again.

Q: I'm getting an error saying "Git is needed to chat with Claude Code." What should I do?

A: The **hackathon-bootstrap** skill is designed to install Git automatically. However, if that process fails, you will need to install Git manually on your machine. If you aren't

sure how to do this, you can actually ask Claude Chat to walk you through the manual Git installation steps for your specific operating system.

Q: How do I download Docker for Windows (amd64) and Mac?

A:

- **For Windows:** Visit the official [Docker Desktop for Windows](#) page to download the installer. Run the Docker Desktop Installer .exe and follow the default installation prompts.
- **For Mac:** Visit the official [Docker Desktop for Mac](#) page. Download the version that matches your processor (Apple Silicon or Intel). Open the .dmg file and drag Docker to your Applications folder.

Q: Where can I find the registry host and token for pushing my app?

A:

- You can find the registry details in the 'The Guide to Building and Shipping Your Hackathon App' document.
- The host is `registry.buildathon.meesho.dev` and
- The token is `buildathon-claude-2026-push-token`.
